

MICROGRAM

BUREAU OF NARCOTICS AND DANGEROUS DRUGS / U.S. DEPARTMENT OF JUSTICE

Vol. I, No. 7 Edited by Investigative Services Branch April, 1968

NEW BUREAU

The Bureau of Drug Abuse Control joined the Federal Bureau of Narcotics on April 8, 1968, to become the new Bureau of Narcotics and Dangerous Drugs in the Department of Justice.

STP CONTROLLED

4-Methyl-2, 5-dimethoxyamphetamine, also known as "DOM", or "STP", was placed under control April 2, 1968.

INDIA BEEDI

We have a report that students on a Florida campus are smoking "India Beedi" cigarettes in the belief that they contain peyote.

According to Internal Revenue Service's Alcohol and Tobacco Tax Laboratory, Washington, D.C., the cigarettes are a Government-sponsored home industry of India and are legally imported into the U.S.

The cigarettes contain tobacco, hand-rolled in a witch hazel leaf which has been soaked in a tobacco extract. They weigh about 0.5 gram each. The tobacco weighs about 0.14 gram and contains 3.2% nicotine. The witch hazel leaf contains about 0.5% nicotine from the tobacco extract.

Cigarettes obtained by officers have been tested several times for drugs and narcotics, but have been found negative.

DIPROPYLTRYPTAMINE (DPT)

One of our Field Offices recently encountered this "new" drug sprayed on parsley cigarettes. The manufacturer, a research chemist, bragged that he could add a carbon to the tryptamines and stay ahead of the law indefinitely. Dipropyltryptamine is reported to be physiologically active, but we understand that dibutyltryptamine is not.

CAUTION: Use of this publication should be restricted to forensic analysts or others having a legitimate need for this material.

MICRO-GRAM INDEX

Issues No. 1 through No. 6, Volume I
(November, 1967 - March, 1968)

<u>Subject</u>	<u>Issue No.</u>
3-(2-aminopropyl) indole (IT-290)	6
Amphetamine Tablets	5 6
Analysis	
Amphetamines	5
Bufotenin	2
Diethyltryptamine (DET)	2 & 4
Dimethyltryptamine (DMT)	2
Dimethyltryptamine (DMT) on parsley	2
Ibogaine	2
LSD	2 & 4
Mescal Buttons	5
Mescaline	4
Methylamphetamine	5
Methylenedioxyamphetamine (MDA)	5
Peyote Buttons	4

Tranquinal	2
Trimethoxyamphetamine (TMA)	4
U-14,164E (see IT-290)	
Wild Carrot (see Queen Anne's Lace)	

comprehensive list of DACA drugs

This comprehensive list of DACA drugs has been compiled by the Bureau of Drug Abuse Control, Food and Drug Administration. The listing includes—in alphabetical order—trade names, non-proprietary names, chemical names and synonyms of DACA-controlled drugs. Products covered are single stimulant, depressant and hallucinogenic drugs, as well as combination products. In parentheses after each trade name is the name of the manufacturer and uncommon synonyms are followed by chemical entity.

Combination products submitted to BDAC with a request for an exemption and for which exemption was denied are denoted by a bullet (*). Products without a bullet are considered to be covered under the Drug Abuse Control Amendments of 1965.

All drugs in this list are now covered by all DACA regulations—including record-keeping provisions and the limitation on the prescription order of six months and five authorized renewals.

FDA still is considering the status of chlorthalidone and its salts (Librium) and diazepam (Valium). FDA has postponed the effective date of the final order listing meprobamate under the 1965 Drug Abuse Control Amendments, pending the outcome of the petition filed by Carter-Wallace in the U.S. Court of Appeals for the Fourth Circuit in Richmond, Va.

This listing now supercedes all previously published listings of DACA-controlled drugs.

list of drugs

A

- A-884 (Methamphetamine)
- *Abactal (Massengill)
- Abadex No. 1, 2 and 3 (ABA)
- Abate (Cambridge)
- *A.C.A.P. (Halsom)
- Acotal (Prof. Drug Service)
- Actemin
- Adetate (M.S. and D.)
- Adipan (Amphetamine Sulfate)
- Adiparthrol (Amphetamine Sulfate)
- Adipex (Methamphetamine)
- Adjudet Troches (Ives)
- Ad-Nil No. 2 (Medics)
- Ad-Nil (Medics)
- Adrizine
- Afatin (d-Amphetamine Sulfate)
- Afettine (d-Amphetamine Sulfate)
- Agrypnal (Phenobarbital)
- *Aironol (Airhart)
- *Airo-Sed (Airhart)
- *Airotol (Airhart)
- Aktedron
- *Aladrine Tablets (Table Rock)
- *Aladrine Tablets and Liquid (Merit)
- *Aladrine Liquid (Table Rock)
- *Alafed (Crest)
- Albemap (d-Amphetamine Sulfate)
- *Albutal (Medical Arts)
- Alentol (Amphetamine Sulfate)
- *Alepsal (Fougera)
- *Alias No. 2 (Superior)
- *Alka-Nux (MacEslin)
- Allobarbitol
- Allobarbitone
- Aliodene (Amphetamine Sulfate)
- Allonal Tablets (Roche)
- Allylbarbituric Acid
- Allylisobutylbarbituric Acid
- Allylisopropylbarbituric Acid
- Allylisopropylmalonylurea
- Allylisopropylmethylbarbituric Acid
- Allypropymal
- *Al-Nal-Capsules (Cumberland)
- Alphetamine Capsules (Alpha)
- Alphetamine 10 Capsules (Alpha)
- Alprine (Ulmer)
- Alubarb Elixir (Approved)
- Alurate (Hoffmann-La Roche)
- Alurate Sodium (Hoffmann-La Roche)
- Alurate Verduum Elixir (Hoffmann-La Roche)
- *Aluro (Foy)

MEPHENTERMINE SULFATE (WYAMINE) TABLETS

F. E. Yarnall
Kansas City District Laboratory
U.S. Food and Drug Administration

Recent purchases of alleged methamphetamine tablets were found to actually be the above product. This compound closely resembles d-methamphetamine in the volatility test with gold chloride. The hydrochloride derivative prepared from it has nearly identical melting point to that of d-methamphetamine. The picrate derivative melting point and the infra-red spectra of the hydrochloride derivative differentiate it from d-methamphetamine. The subject tablets contain 25 milligrams, which is greater than encountered in methamphetamine products.

TLC OF SOME SYMPATHOMIMETICS

Raymond C. Grant, National Center for Drug Analysis,
St. Louis, Mo.

Recently this laboratory needed a rapid and effective alternate method to distinguish between some of the common sympathomimetics such as amphetamine, methamphetamine, phenylpropanolamine, and ephedrine.

Four samples of white double-scored tablets were received in this laboratory for qualitative and quantitative analysis of the active ingredients. Routine examinations by the gold chloride test (1) produced needles similar to d-amphetamine.

Prior analysis by the local Police Department had indicated the presence of caffeine; therefore, the samples were chromatographed according to the NF XII procedure for amphetamine sulfate (2). The chloroform wash was used for the caffeine assay. The TLC and subsequent IR analyses showed that the compound thought to be amphetamine was actually ephedrine. The tablets contain 15 mg ephedrine sulfate and 200 mg caffeine.

Method

Reagents

(a) Standards of sympathomimetics.--Solutions of 50 mg/ml in water of each of the following compounds: amphetamine HCl, phenylpropanolamine HCl, methamphetamine HCl, and ephedrine HCl.

(b) Mixed standard.--Mix 0.5 ml of each of the individual standards of (a).

(c) Caffeine standard.-- 1 mg/ml in chloroform.

(d) Developing solvent.--Acetonitrile:benzene:ethyl acetate: concentrated NH_4OH (60:15:10:10) (3).

(e) Iodoplatinate spray reagent.--Mix 3 ml 10% platinum chloride with 97 ml water; then mix this solution with 100 ml 6% aqueous KI (4). Heat on the steam bath for 30 min or age one day to give desired color development.

Equipment

(a) TLC plates.--Use silica GF plates (Mallinckrodt Chemical Works, No. 7105) or equivalent at 250 μ thickness. Air-dry the plates overnight and store in an undesiccated cabinet.

(b) UV light.--Short wave, or chromato-vue, equipped with one short wave 15 watt lamp.

(c) Micropipets.--5 and 10 μ l.

(d) Chromato-sprayer.--Warner-Chilcott Laboratory Instrument Division, or equivalent.

(e) Developing tank.--Stainless steel, 9 x 9 x 3 1/2", or equivalent. Line with four 8 x 8" sheets of Whatman 3MM filter paper to aid equilibration. Equilibrate for 15 min before chromatographing samples.

Procedure

Finely powder one tablet and prepare as in the NF XII assay for amphetamine sulfate (2).

Evaporate the 100 ml chloroform pre-wash to 10 ml. Spot 5 μ l of this concentrate on the silica GF plate and view the spot under short wavelength UV light. Any UV-absorbing compound extracted from the column, such as caffeine, will appear as a dark spot against a white background.

Extract and assay amphetamine and similar sympathomimetics according to the NF XII assay (2). Make alkaline with NaOH and re-extract the basic compounds from the aqueous phase into 15 ml of chloroform. Filter the chloroform layer through a pledget of cotton into a 20 ml beaker. Add two drops of concentrated HCl to the filtrate and evaporate to dryness. Use 2 mg of the residue to make a KBr pellet for IR identification and use a small portion for chemical microscopy. Take up the remainder of the residue in 2-3 drops of distilled water and spot 10 μ l of this solution on the plate with the caffeine or other suspected compounds found in the chloroform pre-wash. Spot 5 μ l of the individual sympathomimetic standards and the caffeine standard, and 10 μ l of the mixed standards. The spots of the aqueous solutions of standards and samples should be dried with the aid of a stream of air from a hair dryer or similar source. View the plate under UV light after spotting to insure that a large enough quantity of the sample has been spotted.

Develop the plate in a tank previously saturated with developing solvent. After development dry the plate in a forced draft oven at 60°C for 5 min and view under shortwave UV. To obtain more information spray the plate with the iodoplatinate spray reagent. (Make sure the odor of ammonia is no longer detectable on the plate before spraying.) The four sympathomimetic amines will give different colored spots against a pink background. Their descriptions and corresponding R_F values are reported in Table 1. As little as 25 µg of the sympathomimetics can be detected if the plates are modified by using a thin column method (5).

Table 1. TLC of sympathomimetics and caffeine

Compound	R _F x 100	Color of Spot	
		Iodoplatinate	UV Light
Amphetamine HCl	40	Blue	Blue
Methamphetamine HCl	34	Purple	Blue
Phenylpropanolamine HCl	29	Tan	Blue
Ephedrine HCl	26	Tan w/purple halo	Blue
Caffeine	61		Dark blue

GAS CHROMATOGRAPHIC IDENTIFICATION OF SEVERAL BDAC DRUGS

James Heagy and James Look
San Francisco District

The following method was developed to identify illegal drugs in BDAC samples. The method has been helpful in detecting STP (2,5-dimethoxy-4-methyl amphetamine) and other drugs in capsules of LSD (Lysergic acid diethylamide).

Procedure:

Add powdered or liquid sample equivalent to one dose to a separatory funnel containing 10 ml of water. Neutralize with (1+1) HCl, if basic, and add one drop excess HCl. Extract with 15 ml CHCl₃, discarding the CHCl₃ layer. Neutralize with 6N NaOH and add one drop excess. Extract with two 15 ml portions of CHCl₃, filtering the extracts through a small cotton wad placed in funnel stem. Evaporate the CHCl₃ to a small volume, add 5 drops of (1+5) HCl and evaporate to dryness. Take up the residue in 5 ml of methanol and inject 5 ul. Dilute as necessary to give useful peak heights.

Apparatus:

BC 5000 gas chromatograph with KCl thermionic detector. (1)

Column: 10% DC 200 on Gas Chrom Q 80/100 mesh
length: 6 ft, diameter: 4 mm

Column Temperature 200° C
Injector Temperature 201° C
Detector Temperature 208° C

Nitrogen Flow Rate 85 cc/min
Hydrogen Flow Rate 27 cc/min
Air Flow Rate 290 cc/min

Sensitivity 30X
Attenuation 2

Results:

Retention times were measured from the solvent peak, not the time of injection.

<u>Compound</u>	<u>Retention time (min)</u>	<u>R_pphenmetrazine</u>
1. dl-amphetamine	.84	.34
2. d-desoxyephedrine	.99	.40
3. phenmetrazine	2.44	1.00
4. STP	4.01	1.68
5. mescaline	5.27	2.12
6. N,N-dimethyltryptamine	7.18	2.95
7. N,N-diethyltryptamine	11.7	4.85

Discussion:

The retention times given above were obtained from injection of 4 microliters of a mixture of 2 to 5 mg of each drug in 20 ml of methanol. Temperature programming from 130° C to 220° C gave better separation of amphetamine and desoxyephedrine but programming is less reproducible than a constant temperature system.

LSD has been run by gas chromatography at a much higher temperature on another column (2), but the Look test (3) is recommended to screen for drugs containing the indole ring system since it is rapid and requires only simple reagents.

Continued investigation of this method is planned.
